MAYNE MAPS - MACADAMIA ORCHARD MAPS

To map a macadamia orchard such as this, Alan uses many sources of data.

He extracts the relevant information from topographic maps as well as from satellite images.

The map is updated with any farm irrigation maps or other maps that the owner may have. Spreadsheet information is then included.

To complete the project, GPS data is often used. This data can be collected by the property owner or collected by Alan on-site.

If the property owner captures his own GPS information, the GPS files can be emailed to Alan to reduce costs.

When the map is finished, it can be exported into a multitude of file types depending on the needs of the client.

The maps can be used in the office, for promotion on the internet, for developing the property and for marketing.

This map can be georeferenced and used by management as an actual map for managing and running the property.

Exciting new GPS technology enables GPS receivers to use these maps on the face of the GPS units. This enables the property owner to move around his property viewing his property map moving past him on his GPS screen - ideal for precise GPS navigation and recording.

Property maps have been produced for properties in South Australia, Tasmania and New Zealand without Alan leaving Queensland.

Many property owners request a Location Map for the property to assist people locate the property when visiting. (See Location Map Tab)

This map cost less than \$1000 and was completed without Alan leaving his office.

Alan invites you to find a map similar to your property. Give him a call and obtain a quote.
