

MAYNE MAPS - SMALL CROPS FARM MAPS

VEGETABLE FARM MAPS

To map a small crops or vegetable farm such as this, Alan uses many sources of data.

He extracts the relevant information from topographic maps as well as satellite images.

This is updated with any farm irrigation maps and other maps that the owner may have. Spreadsheet information is then included.

To complete the project, GPS data is often used. This data can be collected by the property owner or collected by Alan on-site.

If the property owner collects his own GPS information, the files can be emailed to Alan to reduce costs.

When the map is finished, it can be exported into a multitude of file types depending on the needs of the client.

The maps can be used in the office, for promotion on the internet, for developing the property and for marketing.

The map can be georeferenced and used by management as an actual map for managing and running the property.

Exciting new GPS technology enables GPS receivers to use these maps on the face of the GPS units. This enables the property owner to move around his property viewing his property map moving past him on his GPS screen - ideal for precise GPS navigation and recording.

Property maps have been produced for properties in South Australia, Tasmania and New Zealand without Alan leaving Queensland.

Often property owners ask for Location Maps to help visitors locate the property when they visit. (See Location Map Tab).

Most of the maps produced by Mayne Maps cost less than \$1000 but the cost depends on a number of factors.

Alan invites you to find a map similar to your property. Give him a call and obtain a quote.
